

Updating to Sovereign AI Brain 7.0.2

One download, one install. No terminal.

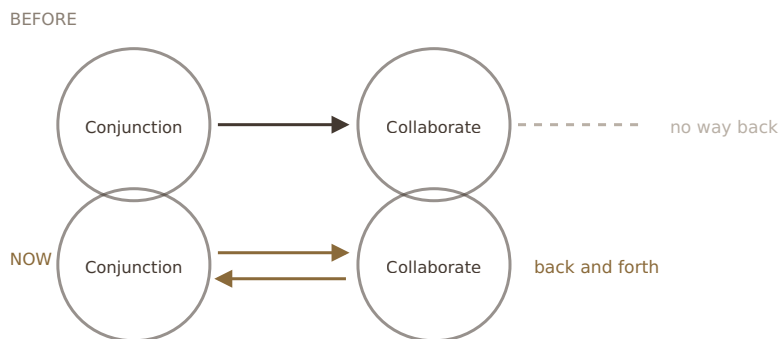

28 September 2026

What's new

A screen you could enter and not leave now has a way back

From the **Conjunction** tab, “Boards & pairing” and “Pair a second Centurion” opened the **Collaborate** screen — and there was nothing on it to take you back. The tab still read Conjunction while the screen showed Collaborate, so the screen did not match its own label, and no control existed to return. The owner was simply stuck, with no exit and no explanation.

A **Back to Conjunction** control now sits at the top of that screen. The way in is a door rather than a trapdoor.

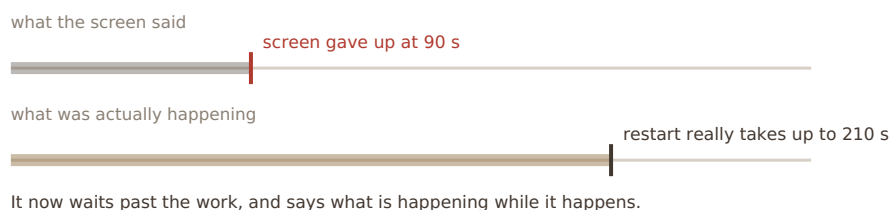

Above: the Conjunction tab could send you into the Collaborate screen, and the dashed route back did not exist — the tab still read Conjunction, the screen showed Collaborate, and there was no control to press. Below: the same two screens, with the return now present.

It stops saying it failed while it is still working

Pressing “**Make this Centurion reachable**” restarts the part of your Brain that listens for the other machine. The screen waited 90 seconds and then reported that it was still not reachable — but that restart can legitimately take **210 seconds**, because it finishes what it is already doing before it stops.

It was announcing a failure mid-repair. Worse, it fired a *second* restart 15 seconds in, so two were racing the same service. It now waits past the work, restarts one service at a time, and while it is working it says so.

The screen announced a failure 120 seconds before the repair it had asked for was even due to finish. Nothing was wrong with the repair; the clock was wrong.

And when it cannot finish, it says what will

Your two values — the Address and the Secret — are saved whether or not the listener has bound. The screen now says that plainly and names the single control that finishes the job, instead of leaving you to be told to disregard a warning. A product should not ask that of you.

If you saw either of these, this is the release for you

Both were dead ends of our making: a screen you could enter and not leave, and a status line that called a repair failed while it was still running. Neither could be worked around from inside the app, and neither was anything you did.

How to update

1. Sign in and open **Account → Get Brain**. Your download sits at the top of the page.
2. Double-click the downloaded file and choose **Install**. Fedora may ask for your password — that prompt is your computer, not us.
3. **Reopen Sovereign AI Brain**. It sets its own services up and starts them. Nothing else to run.

Check the download if you like. The sha256 above is the exact file we published: 3c2bae979a2c9d0ce021de1fcf2a8a28cf57db007f49e06717abcc8888e6abca — about 93.6 MB.

Signed with Centurion's release key. No reboot is needed — reopening the Brain is enough. Your data, your Soul and your sessions are untouched by this update.
