

Updating to Sovereign AI Brain 7.0.3

One download, one install. No terminal.

28 September 2026

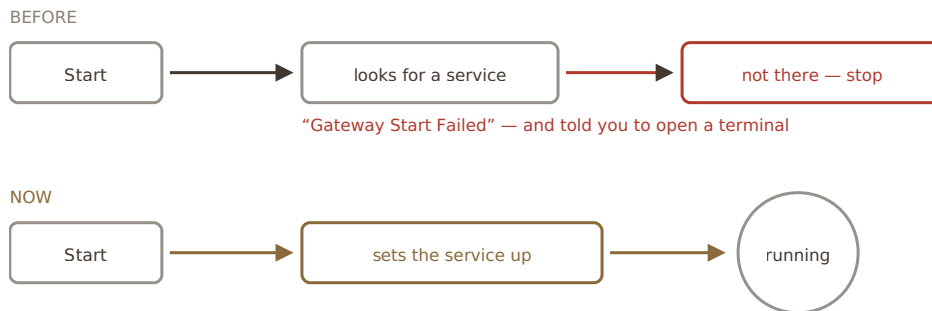

What's new

Start now sets the gateway up instead of refusing

The **gateway** is the part of your Brain that listens for the other machine — what another Centurion reaches when the two of you connect. It runs as a background service, and that service is created by the setup wizard and by **nothing else**. The installer ships no copy of it. So every Brain installed from the installer has had no gateway service at all.

Pressing **Start** checked for that service and stopped there: **“Gateway Start Failed”**, no reason, and an instruction to open a terminal and type a command. Nothing was broken. There was simply nothing to start, and the button would not build it.

Start now **creates the service when it is missing**, enables it so it comes back after a restart, and starts it. You press Start, and it starts.

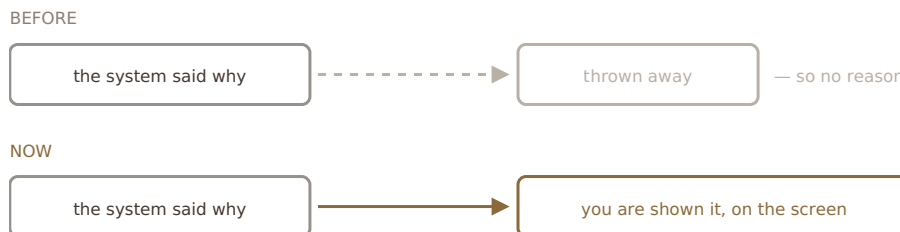

Above: the button checked for the gateway service, found none, and stopped there — the service is created by the setup wizard and by nothing else, so a Brain installed from the installer never had one. Below: the same button, now creating what is missing and starting it.

And that failure no longer takes the Brain's own control channel down with it

The check behind the button exited the whole process rather than reporting a problem — a kind of exit the app is unable to catch. So the reason never reached your screen even when the system had given one.

It now raises an ordinary error that the app can read and show. The app's own restart path has been moved onto the same repair, and it no longer discards the system's explanation when a restart fails.

The reason a restart failed was discarded before anyone could read it, so the screen could only report that something had gone wrong. Failures now carry their explanation through to the owner.

No step asks you to open a terminal

A customer should never be handed a shell command, and this release removes the last one that was being shown to owners. If any screen ever tells you to type a command, that is a defect — report it and we will fix it.

If you pressed **Start** and it failed, this is your release

It was not your machine and it was not your mistake. The gateway service had never been created on it, because nothing but the setup wizard ever created one — and Start refused rather than doing it. That is a dead end of our making, and it is the reason two Brains could not be connected on a machine where nothing was actually wrong.

How to update

1. Sign in and open **Account → Get Brain**. Your download sits at the top of the page.
2. Double-click the downloaded file and choose **Install**. Fedora may ask for your password — that prompt is your computer, not us.
3. **Reopen Sovereign AI Brain**. It sets its own services up and starts them. Nothing else to run.

Check the download if you like. The sha256 above is the exact file we published: 2e0b0374d2a26b294189337d1ebb15a1c676e4e91895337e4c63f72a2c57c89a — about 93.7 MB.

Signed with Centurion's release key. No reboot is needed — reopening the Brain is enough. Your data, your Soul and your sessions are untouched by this update.
