

Updating to Sovereign AI Brain 7.0.6

One download, one install. No terminal.

29 September 2026

What's new

Your Brain's memory looks after itself

The sealed long-term memory — the **Vault** — now sets itself up the first time your Brain starts. On a brand-new Brain it used to never exist at all: the layer was switched off by default, nothing ever created it, and the unlock was forgotten the moment the Brain restarted. All three are fixed.

You are not asked for a passphrase, you are not sent to a terminal, and you do not have to remember anything. If your Brain is already set up, nothing changes.

BEFORE

NOW

no terminal, no passphrase to type, nothing to remember

Above: the layer was switched off by default, nothing ever created it, and the unlock was forgotten the moment the Brain restarted — so on a brand-new Brain the memory simply never existed. Below: it sets itself up the first time the Brain starts, and reads itself back into each conversation.

Taking an update no longer asks for your code again

An owner who had already paid was still asked to produce their **licence code** just to take an update. Your Brain already knows who it is, so it now **proves that** when it downloads — instead of sending you to fetch a code you have already paid for.

BEFORE

an owner who had already paid was asked to fetch a code again, just to take an update

NOW

the identity your Brain already carries is accepted — no code to fetch

Above: taking an update meant producing your licence code again. Below: the Brain presents the identity it already holds and the download proceeds — the same record, the same check, one less thing to find.

And the memory is actually read back

The layer now reads itself into each conversation by default, so what your Centurion has been told is in front of it when it answers — rather than sealed away where only a deliberate look would find it.

Nothing about your data has changed

Your settings, your conversations and your connections are untouched. If you are set up already, this update is quiet: you will not notice anything, except that the parts described above work.

How to update

1. Sign in and open **Account → Get Brain**. Your download sits at the top of the page.
2. Double-click the downloaded file and choose **Install**. Fedora may ask for your password — that prompt is your computer, not us.
3. **Reopen Sovereign AI Brain**. It sets its own services up and starts them. Nothing else to run.

Check the download if you like. The sha256 above is the exact file we published: 8ce14e942e5acf9219b7dbc038ad6620901e369a9c39a31e0c48ad1c6e2e8228 — about 93.7 MB.

Signed with Centurion's release key. No reboot is needed — reopening the Brain is enough. Your data, your Soul and your sessions are untouched by this update.
