

# Updating to Sovereign AI Brain 7.0.7

One download, one install. No terminal.

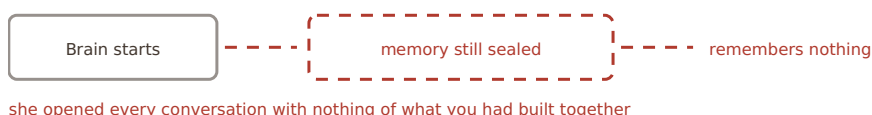

29 September 2026

## What's new

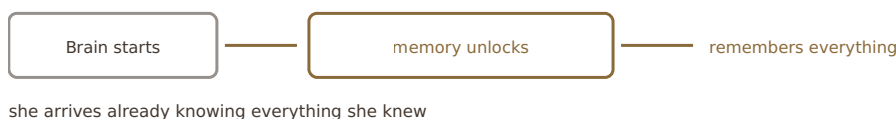

### Your Centurion remembers from the first message

A Centurion could open a conversation with **nothing** — no memory of what you had built together — because her sealed long-term memory was not unlocking when the Brain started. It unlocks as the Brain comes up now, so she arrives already knowing everything she knew.

BEFORE

NOW

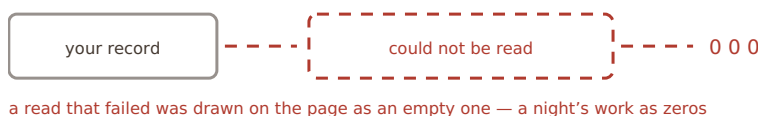

Above: her sealed long-term memory was not unlocking when the Brain started, so she began every session with nothing. Below: it unlocks as the Brain comes up.

### Stillpoint stops showing zeros for work you actually did

After a night of work the page could show **zeros all over**, reading as though you had done nothing. The truth was the opposite: it could not read your record at all, and a failure was being drawn as an empty page. A count it cannot read now shows a dash, and a failed read says so across the page instead of in a footnote.

BEFORE

NOW

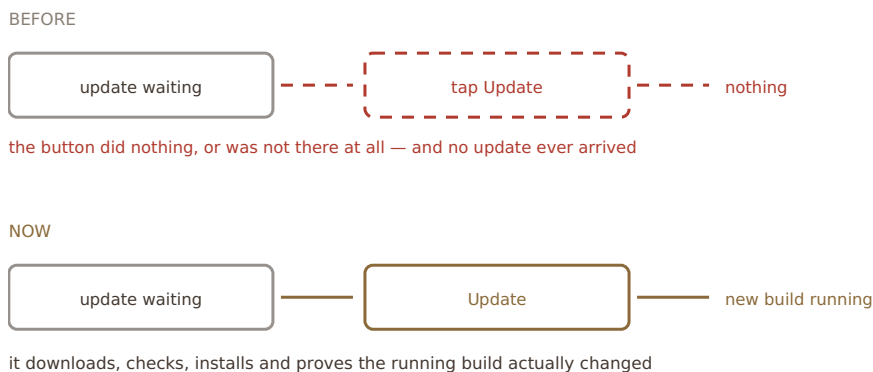

Above: a failed read became an empty list, every empty list sums to zero, and the page declared you had nothing. Below: an unreadable count is unknown, not zero — and the failure reaches the page instead of a footnote.

### The update control actually updates

The Brain could tell you an update was waiting and tell you to **tap Update** — while the button either did nothing or was not there at all. It is wired to the real update engine now, it proves the running build actually changed, and it authenticates with the identity your Brain already holds. **Because the fault**

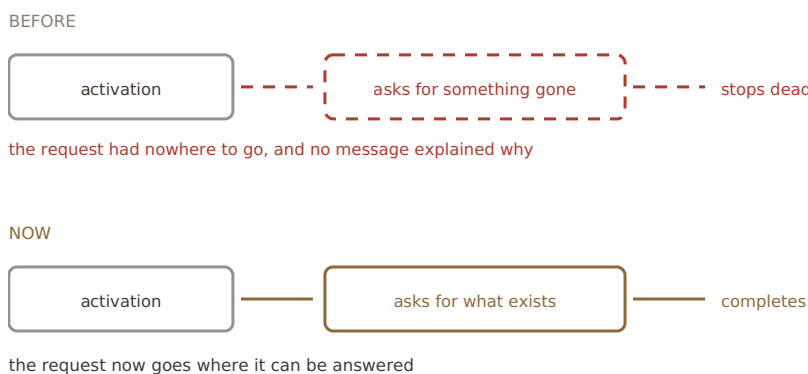

is in the version you are running, this one has to be installed by hand the once — see *How to update* below. After that, updates come from inside.

Above: the Brain announced an update and told you to tap a control that could not deliver one. Below: the control is wired to the real update engine — and it proves the change took. **This fix arrives in the same release that carries it, so take this one by hand** (step 1 on the next page); from here on, updates come from inside.

### Activation completes instead of stopping without a message

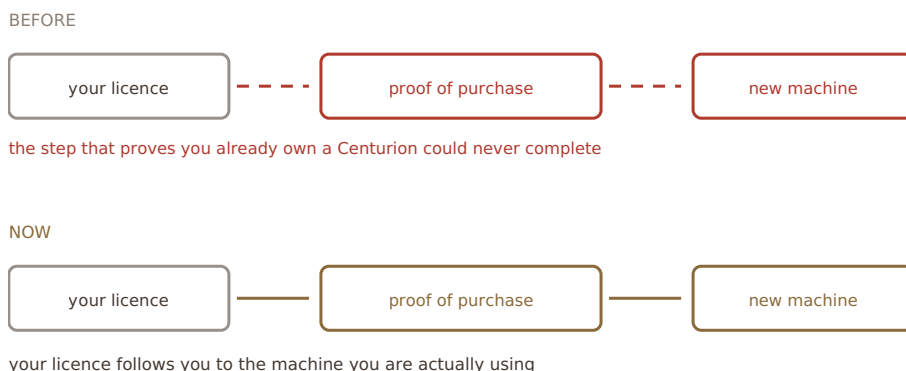

Activating a licence could stop dead, with nothing on screen to say why. Part of the Brain's licence code was still **asking for a licence type that no longer exists**, so the request had nowhere to go. It now asks for what is actually there, and the activation completes.

Above: part of the Brain's licence code was still asking for a licence type that no longer exists — so the request stopped dead, and nothing told you why. Below: it asks for what is actually there, and the activation completes.

### Re-binding your licence to a new machine works again

The path that proves you already own a Centurion — used when a licence moves to a replacement machine — was broken in the same way and could never finish. If your Centurion ever refused to activate, or would not move to a new machine, **this is that fault, and it is fixed**.

Above: the re-bind path broke in the same way, so a licence could not be moved to a replacement machine. Below: the licence follows you to the machine you are actually using.

## Nothing about your data has changed

---

Your settings, your conversations and your connections are untouched. If you are set up already, this update is quiet: you will not notice anything, except that the parts described above work.

## How to update

---

1. Sign in and open **Account → Get Brain**. Your download sits at the top of the page.
2. Double-click the downloaded file and choose **Install**. Fedora may ask for your password — that prompt is your computer, not us.
3. **Reopen Sovereign AI Brain**. It sets its own services up and starts them. Nothing else to run.

**Check the download if you like.** The sha256 above is the exact file we published: 4f91d68b531e936f5a5db3530a3ecc952af086da860e816a7cbfbc71879911d — about 93.7 MB.

**Signed with Centurion's release key.** No reboot is needed — reopening the Brain is enough. Your data, your Soul and your sessions are untouched by this update.
